ASWGA Mudgee Region Report

March 2008

Since my last report there has been some water under the bridge with this area receiving some good falls of rain from November through to the end of February. Rainfall has varied throughout the Mudgee Region with some areas getting more than others. In the Sally's Flat area we received approximately 450mm of rain which caused us to have a late spring.

As a result of this, summer grasses went berserk and we now have a bit of seed in the wool, but, we are not complaining. Most members in the area are still in survival mode and are still not sure what the weather will do.

Wool is growing quite well as hand feeding has now stopped and sheep have plenty of feed and water in the paddocks.
